

Local convergence in t-PNG

joint with Ruby Bestwick, Artem Borisov, Elnur Emrah, and
Jessica Jay

Márton Balázs

University of Bristol

Universality in the Kardar-Parisi-Zhang class and random
matrix theory

ICMS, Bayes Centre, Edinburgh

June 2026.

Polynuclear Growth

t-PNG

Stationary *t*-PNG

Local convergence

Ingredients

Proof

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
-

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
 - ▶ Nucleations spread at unit speed
-

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
 - ▶ Nucleations spread at unit speed
 - ▶ They annihilate upon meeting
-

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
 - ▶ Nucleations spread at unit speed
 - ▶ They annihilate upon meeting
 - ▶ \rightsquigarrow height function
-

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
 - ▶ Nucleations spread at unit speed
 - ▶ They annihilate upon meeting
 - ▶ \rightsquigarrow height function
-

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
 - ▶ Nucleations spread at unit speed
 - ▶ They annihilate upon meeting
 - ▶ \rightsquigarrow height function
-

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
 - ▶ Nucleations spread at unit speed
 - ▶ They annihilate upon meeting
 - ▶ \rightsquigarrow height function
-

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
 - ▶ Nucleations spread at unit speed
 - ▶ They annihilate upon meeting
 - ▶ \rightsquigarrow height function
-

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
 - ▶ Nucleations spread at unit speed
 - ▶ They annihilate upon meeting
 - ▶ \rightsquigarrow height function
-

Polynuclear Growth (PNG) [Hammersley '72]

- ▶ Poisson space-time points initiate nucleations
 - ▶ Nucleations spread at unit speed
 - ▶ They annihilate upon meeting
 - ▶ \rightsquigarrow height function
-

Polynuclear Growth (PNG) [Hammersley '72]

Theorem

*Yes, the boundaries of the small box converge in distribution to the two independent stationary Poisson processes with an explicit $\lambda = \lambda(\mathbf{v})$ (*direction*).*

Local convergence

Theorem

*Yes, the boundaries of the small box converge in distribution to the two independent stationary Poisson processes with an explicit $\lambda = \lambda(\mathbf{v})$ (*direction*).*

- ▶ Confirms the conjecture from [Drillick, Lin '24].

Local convergence

Theorem

*Yes, the boundaries of the small box converge in distribution to the two independent stationary Poisson processes with an explicit $\lambda = \lambda(\mathbf{v})$ (*direction*).*

- ▶ Confirms the conjecture from [Drillick, Lin '24].
- ▶ Hence the full t -PNG inside the small box converges to stationary t -PNG.

Local convergence

Theorem

*Yes, the boundaries of the small box converge in distribution to the two independent stationary Poisson processes with an explicit $\lambda = \lambda(\mathbf{v})$ (*direction*).*

- ▶ Confirms the conjecture from [Drillick, Lin '24].
- ▶ Hence the full t -PNG inside the small box converges to stationary t -PNG.
- ▶ The actual limit intensities are $\frac{1}{\sqrt{1-t}} \sqrt{\frac{v_2}{v_1}}$ for **sources** and $\frac{1}{\sqrt{1-t}} \sqrt{\frac{v_1}{v_2}}$ for **sinks**.

Shape theorem [Drillick, Lin '24]

Define $L_x :=$ no. of lines entering the bottom or right edge.

Then $L_x =$ no. of lines exiting the left or top edge.

Shape theorem [Drillick, Lin '24]

Define $L_{\mathbf{x}}$:= no. of lines entering the bottom or right edge.

Then $L_{\mathbf{x}} =$ no. of lines exiting the left or top edge.

Theorem

With zero boundaries,

$$\lim_{\mathbf{x} \rightarrow \infty} \frac{L_{\mathbf{x}}}{|\mathbf{x}|} = 2 \sqrt{\frac{v_1 v_2}{|\mathbf{v}|^2 \cdot (1-t)}}.$$

\curvearrowleft : prob. t

\rightsquigarrow rightmost $\frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}}$ second class still left of the small box whp.

$$\theta^{-,-} \leq \frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}} \geq \alpha^{\lambda,\lambda}$$

3. $\frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}}$ on $\frac{\omega^{\lambda+\varepsilon,-}}{\alpha^{\lambda,\lambda}}$: we have drift!

$$\left\{ \frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}} \right\} \subseteq \left\{ \frac{\omega^{\lambda+\varepsilon,-}}{\alpha^{\lambda,\lambda}} \right\}$$

↶: prob. 1

↷: prob. t

↷ rightmost $\frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}}$ second class still left of the small box whp.

$$\theta^{-,-} \leq \frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}} \geq \alpha^{\lambda,\lambda}$$

4. Conclusion

Rightmost $\frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}}$ second class still left of the small box whp.

$$\theta^{-,-} \leq \underline{\omega^{\lambda+\varepsilon,-}} \geq \underline{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}} \geq \alpha^{\lambda,\lambda}$$

4. Conclusion

Rightmost $\frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}}$ second class still left of the small box whp.

$\rightsquigarrow \omega^{\lambda+\varepsilon,-} = \eta^{\lambda+\varepsilon,\lambda+\varepsilon}$ in the small box whp.

$$\theta^{-,-} \leq \underline{\omega^{\lambda+\varepsilon,-}} \geq \underline{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}} \geq \alpha^{\lambda,\lambda}$$

4. Conclusion

Rightmost $\frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}}$ second class still left of the small box whp.

$\rightsquigarrow \omega^{\lambda+\varepsilon,-} = \eta^{\lambda+\varepsilon,\lambda+\varepsilon}$ in the small box whp.

\rightsquigarrow but $\eta^{\lambda+\varepsilon,\lambda+\varepsilon}$ is stationary so has $\text{Poi}(\lambda + \varepsilon)$ lines entering the box whp.

$$\theta^{-,-} \leq \underline{\omega^{\lambda+\varepsilon,-}} \geq \underline{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}} \geq \alpha^{\lambda,\lambda}$$

4. Conclusion

Rightmost $\frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}}$ second class still left of the small box whp.

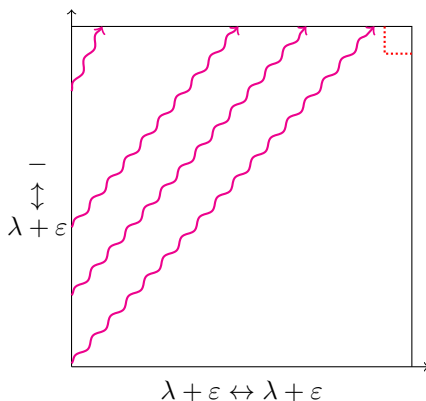

$\rightsquigarrow \omega^{\lambda+\varepsilon,-} = \eta^{\lambda+\varepsilon,\lambda+\varepsilon}$ in the small box whp.

\rightsquigarrow but $\eta^{\lambda+\varepsilon,\lambda+\varepsilon}$ is stationary so has $\text{Poi}(\lambda + \varepsilon)$ lines entering the box whp.

\rightsquigarrow whp. $\theta^{-,-} \leq \text{Poi}(\lambda + \varepsilon)$
 $\forall \varepsilon > 0$.

$$\theta^{-,-} \leq \underline{\omega^{\lambda+\varepsilon,-}} \geq \underline{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}} \geq \alpha^{\lambda,\lambda}$$

4. Conclusion

Thank you.

Rightmost $\frac{\omega^{\lambda+\varepsilon,-}}{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}}$ second class still left of the small box whp.

$\rightsquigarrow \omega^{\lambda+\varepsilon,-} = \eta^{\lambda+\varepsilon,\lambda+\varepsilon}$ in the small box whp.

\rightsquigarrow but $\eta^{\lambda+\varepsilon,\lambda+\varepsilon}$ is stationary so has $\text{Poi}(\lambda + \varepsilon)$ lines entering the box whp.

\rightsquigarrow whp. $\theta^{-,-} \leq \text{Poi}(\lambda + \varepsilon)$
 $\forall \varepsilon > 0.$

$$\theta^{-,-} \leq \underline{\omega^{\lambda+\varepsilon,-}} \geq \underline{\eta^{\lambda+\varepsilon,\lambda+\varepsilon}} \geq \alpha^{\lambda,\lambda}$$
